

Protect Yourself From Hepatitis B

Adults living in long-term care facilities are at an increased risk of contracting hepatitis B.

What is hepatitis B?

Hepatitis B is a blood-borne virus that infects the liver. The infection can lead to serious complications, liver diseases such as cirrhosis, and even liver cancer.

The hepatitis B virus
is up to

100x

more infectious
than HIV

An unmanaged chronic
hepatitis B infection
carries a

25%-40%

lifetime risk of developing
liver cancer

The hepatitis B virus
can survive on
surfaces outside the
body for

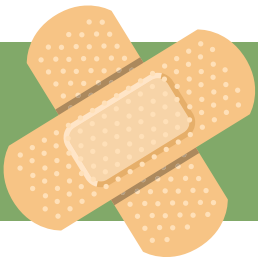

**at least
a week**

HOW IS HEPATITIS B SPREAD?

Hepatitis B is spread through direct contact with infected blood - including dried blood. Most people who are infected with hepatitis B as adults are unaware of how they were exposed to the virus.

WHY DO I NEED THE HEPATITIS B VACCINE?

Although anyone can be at risk for hepatitis B, certain settings and medical conditions can increase a person's risk for hepatitis B, including long-term care facilities, diabetes, and kidney disease.

Hepatitis B vaccination is the best way to protect yourself
and your loved ones against liver cancer.

Hepatitis B has

NO SYMPTOMS

which means it can
spread easily and unknowingly

VACCINES

are safe & effective,
and significantly reduce
your risk of developing
diseases like hepatitis B.
